

Survey for disaster reduction in urban collective housings in Thailand

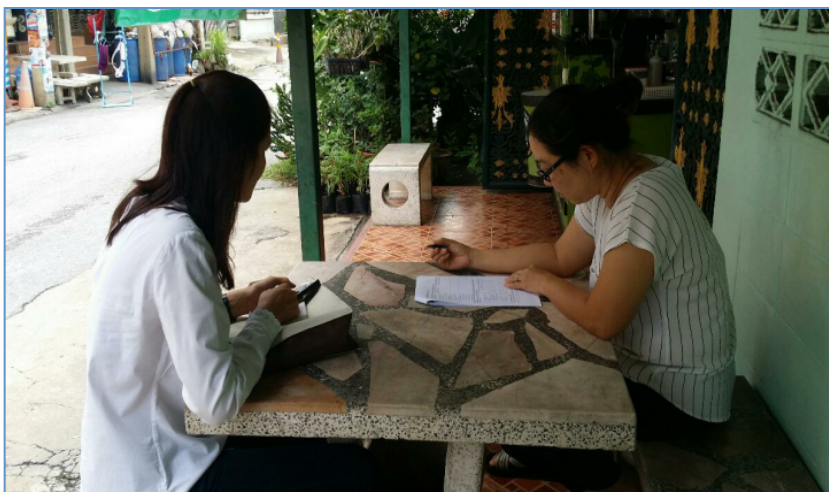

Yukiko Tahira, Research assistant, RNUS, ICUS, AIT

Many people have vivid memory of what happened during 2011 Great Flood in Thailand. In October 2017, six years later, the heaviest rain fall on record in the last 25 years hit Thailand and caused flooding in wide-ranging areas again.

RNUS have conducted questionnaire survey for 200 collective housings (apartment and condominiums) in urban area of Thailand between July and October 2017 in Bangkok metropolitan and the suburbs. Also, we interviewed apartment / condominium managers, residents and staff persons in those collective housings about their view on flood. The purpose of the research is to analyze current status of flood mitigation measures taken by urban housings and the shift of attitudes according as people's lifestyle. The result of the survey and suggestions will be published in journal.
